

Debugging

Roger D. Peng, Associate Professor of Biostatistics Johns Hopkins Bloomberg School of Public Health

Indications that something's not right

- message: A generic notification/diagnostic message produced by the message function; execution
 of the function continues
- · warning: An indication that something is wrong but not necessarily fatal; execution of the function continues; generated by the warning function
- · error: An indication that a fatal problem has occurred; execution stops; produced by the stop function
- · condition: A generic concept for indicating that something unexpected can occur; programmers can create their own conditions

Warning

```
## Warning: NaNs produced
## [1] NaN
```

```
printmessage <- function(x) {
    if(x > 0)
        print("x is greater than zero")
    else
        print("x is less than or equal to zero")
    invisible(x)
}
```

```
printmessage <- function(x) {
    if (x > 0)
        print("x is greater than zero") else print("x is less than or equal to zero")
    invisible(x)
}
printmessage(1)
```

```
## [1] "x is greater than zero"
```

```
printmessage(NA)
```

```
## Error: missing value where TRUE/FALSE needed
```

```
printmessage2 <- function(x) {
    if (is.na(x))
        print("x is a missing value!") else if (x > 0)
        print("x is greater than zero") else print("x is less than or equal to zero")
    invisible(x)
}
x <- log(-1)</pre>
```

```
## Warning: NaNs produced
```

```
printmessage2(x)
```

```
## [1] "x is a missing value!"
```

How do you know that something is wrong with your function?

- · What was your input? How did you call the function?
- · What were you expecting? Output, messages, other results?
- · What did you get?
- · How does what you get differ from what you were expecting?
- · Were your expectations correct in the first place?
- · Can you reproduce the problem (exactly)?

Debugging Tools in R

The primary tools for debugging functions in R are

- · traceback: prints out the function call stack after an error occurs; does nothing if there's no error
- debug: flags a function for "debug" mode which allows you to step through execution of a function one line at a time
- browser: suspends the execution of a function wherever it is called and puts the function in debug
 mode
- trace: allows you to insert debugging code into a function a specific places
- · recover: allows you to modify the error behavior so that you can browse the function call stack

These are interactive tools specifically designed to allow you to pick through a function. There's also the more blunt technique of inserting print/cat statements in the function.

traceback

```
> mean(x)
Error in mean(x): object 'x' not found
> traceback()
1: mean(x)
>
```

traceback

```
> lm(y ~ x)
Error in eval(expr, envir, enclos) : object 'y' not found
> traceback()
7: eval(expr, envir, enclos)
6: eval(predvars, data, env)
5: model.frame.default(formula = y ~ x, drop.unused.levels = TRUE)
4: model.frame(formula = y ~ x, drop.unused.levels = TRUE)
3: eval(expr, envir, enclos)
2: eval(mf, parent.frame())
1: lm(y ~ x)
```

debug

```
> debug(lm)
> lm(y \sim x)
debugging in: lm(y \sim x)
debug: {
    ret.x <- x
   ret.y <- y
    cl <- match.call()</pre>
    . . .
    if (!qr)
        z$qr <- NULL
    Z
Browse[2]>
```

debug

recover

```
> options(error = recover)
> read.csv("nosuchfile")
Error in file(file, "rt"): cannot open the connection
In addition: Warning message:
In file(file, "rt") :
  cannot open file 'nosuchfile': No such file or directory
Enter a frame number, or 0 to exit
1: read.csv("nosuchfile")
2: read.table(file = file, header = header, sep = sep, quote = quote, dec =
3: file(file, "rt")
Selection:
```

Debugging

Summary

- · There are three main indications of a problem/condition: message, warning, error
 - only an error is fatal
- · When analyzing a function with a problem, make sure you can reproduce the problem, clearly state your expectations and how the output differs from your expectation
- · Interactive debugging tools traceback, debug, browser, trace, and recover can be used to find problematic code in functions
- Debugging tools are not a substitute for thinking!
